

WATERPROOF MICROCEMENT

Microröck / Micropool

CEMHER®

Cemher® is the place where the creation of unique rooms begins. Homes with their own personality.

SPACES WITH
SOUL

A SUPERIOR QUALITY

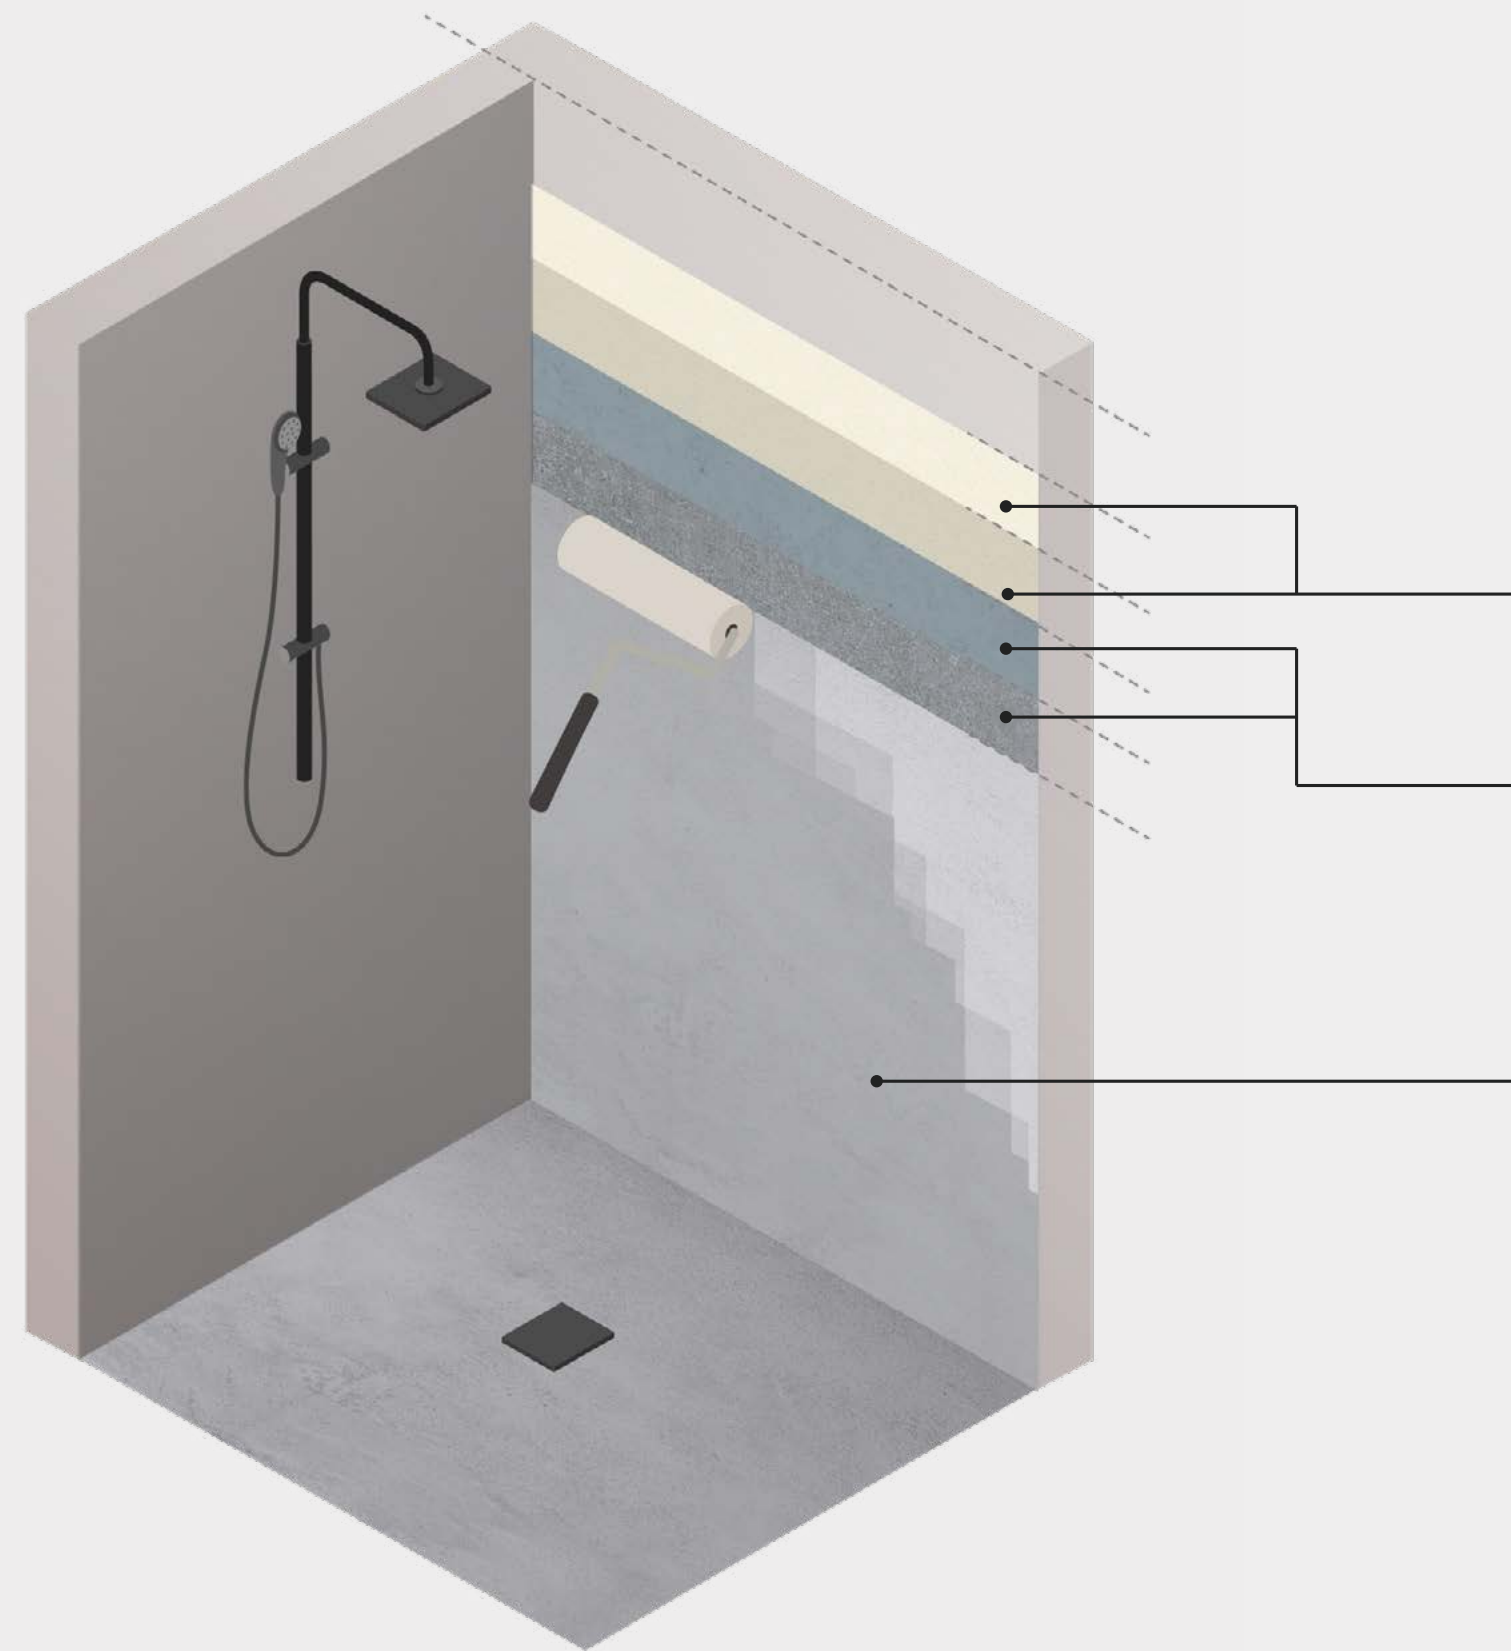

Microröck and **Micropool** are microcements with unequalled performance, whose hardness is superior to that of polished cement. In addition, its resistance to compression and traction is incomparable.

Hardness & Waterproofing

Microröck vs Traditional Microcement

LESS APPLICATION STEPS

1. MICRORÖCK BASE

2 coats must be applied

2. MICRORÖCK/MICRONE FINE

2 coats must be applied

3. SEALER

Must be applied in at least 2 coats

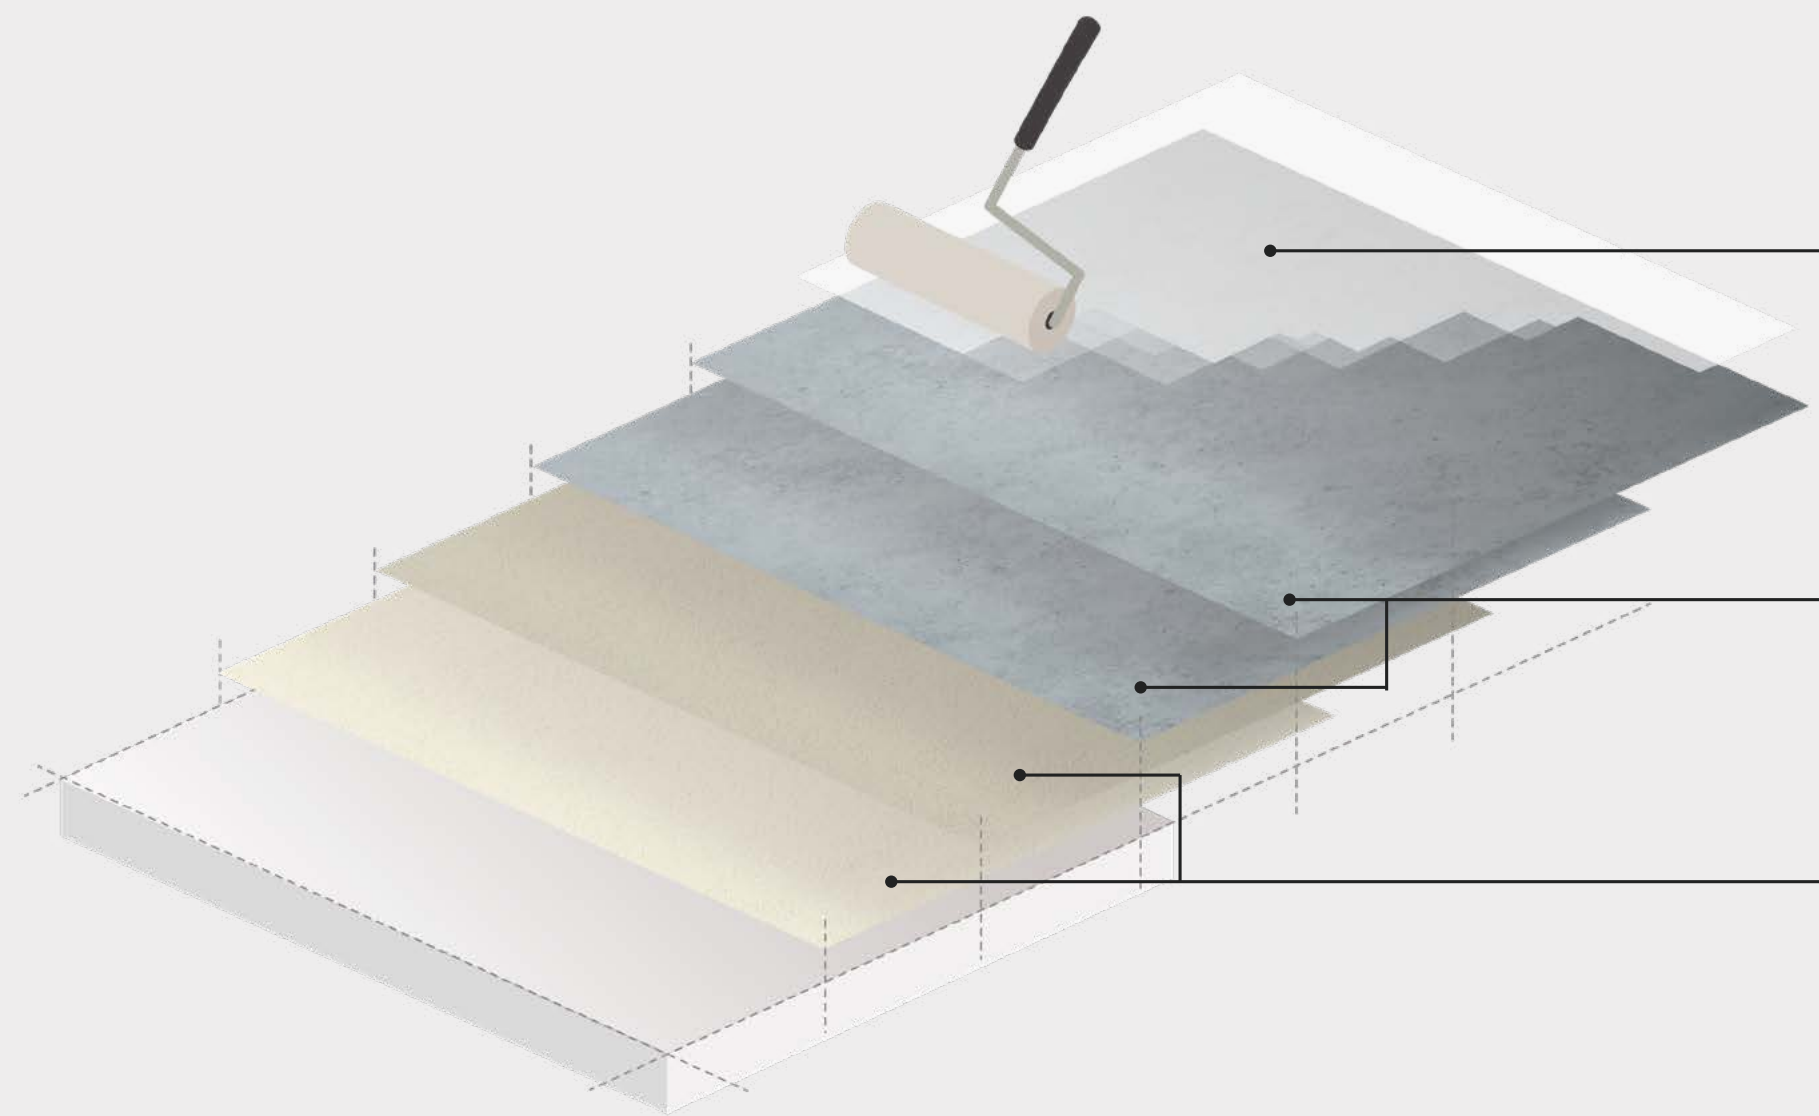

Its high adhesion allows direct application, saving the steps of substrate preparation (mesh, vapor barrier and adhesion promoter). It also avoids the step prior to sealing (pore filling), which means the application of the entire system in less time than traditional microcement.

Micropool vs Traditional Microcement

WATER-IMMERSED SURFACES

It is specially designed for applications on surfaces immersed in water such as swimming pools. Its specific formula creates some water vapor permeability to avoid blistering due to lack of permeability.

3. SEALER

Must be applied in at least 2 coats

2. MICROPOOL FINE

2 coats must be applied

1. MICROPOOL BASE

2 coats must be applied

Thanks to its impermeability, it acts as a vapor barrier and is suitable for all types of surfaces. It can be used in damp areas, first floors as well as bathrooms without fear of any damp problems or defects caused by water.

Microröck does not break or crack, its hardness is 80 MPa. It doesn't stain either. With a high adherence to any support. It is especially indicated to apply in high traffic areas.
